

Privacy Policy Evidence - YouTube API Data Use

API client: **sabotage-minecraft**
Repository: <https://github.com/hakonikomoru/sabotage-minecraft>
Prepared: 2026-06-04

This document is provided as evidence for YouTube API Services quota extension review. It describes how the API client uses YouTube API data, including Google user data, YouTube Live Chat messages, storage, deletion, and security practices.

Privacy Policy Summary

API client	sabotage-minecraft
Operator	Independent creator / developer
Primary purpose	To read YouTube Live Chat messages from the channel owner's own authorized live stream and convert selected chat commands into Minecraft in-game effects.
YouTube API scope	Read-only access for live chat processing. The client does not upload videos, edit metadata, manage third-party channels, or sell YouTube data.
Google Privacy Policy	The application is operated with awareness of the Google Privacy Policy: https://policies.google.com/privacy

YouTube API Data Collected

- Live chat message text needed to detect supported commands such as !slow, !blind, !chicken, !hole, and !block.
- Basic live chat author display information provided by YouTube API responses, used only for cooldown and logging during gameplay.
- OAuth tokens required for the channel owner to authorize live chat access. Tokens are stored only in the Bridge Server environment, not in the Minecraft Addon.

Use of Data

- Live chat messages are processed in real time to create gameplay events in a Minecraft Bedrock Dedicated Server mini-game.
- The application does not create a public database of chat messages.
- The application does not sell, transfer, or use YouTube API data for advertising or profiling.
- The current MVP uses normal YouTube Live Chat commands only. Super Chat and membership events are planned for possible future versions but are currently disabled.

Storage and Retention

- YouTube Live Chat messages are processed at runtime by the Bridge Server and are not intended to be permanently stored.
- Runtime logs may temporarily include command names and author display names for debugging and operational troubleshooting.
- OAuth refresh tokens are stored in a local .env file on the Bridge Server and are never committed to Git.
- Client secrets and refresh tokens are never stored in the Minecraft Behavior Pack.

Deletion Policy

- The channel owner can delete OAuth tokens by removing YOUTUBE_REFRESH_TOKEN from bridge/.env.
- The channel owner can revoke access in their Google Account security settings under third-party app access.
- Runtime logs can be deleted from the local Bridge/BDS environment by the operator.
- Because chat messages are not permanently stored in an application database, there is no separate user-facing deletion workflow for stored chat data.

Security Measures

- OAuth credentials are kept only on the Bridge Server.
- The Minecraft Addon stores only a Bridge API key used to poll the local Bridge endpoint.
- The debug endpoint is development-only and disabled in production mode.
- Polling is limited to gameplay periods and a minimum interval is enforced to reduce unnecessary API calls.

Google API Services User Data Policy

The API client is designed to comply with applicable Google API Services User Data Policy requirements, including limited use, transparency, and secure handling of OAuth credentials. The application does not use YouTube API data for unrelated purposes.
