

OAuth Flow and Feature Evidence

API client: **sabotage-minecraft**

Repository: <https://github.com/hakonikomoru/sabotage-minecraft>

Prepared: 2026-06-04

OAuth Flow Evidence

The API client requires OAuth 2.0 authorization from the channel owner to read YouTube Live Chat messages. There is no password-based account system for viewers or public users.

1	Operator starts Bridge Server locally on <code>http://127.0.0.1:8787</code> .
2	Operator opens <code>/auth/youtube</code> in a browser.
3	Google OAuth consent screen is shown for the configured OAuth client.
4	Operator authorizes read-only YouTube API access for their own channel/live chat.
5	OAuth callback returns to <code>/auth/youtube/callback</code> .
6	Refresh token is copied into <code>bridge/.env</code> and never committed to Git.
7	Bridge polls <code>liveChatMessages.list</code> only while the Minecraft game is active.

Feature Evidence

- Supported MVP commands: `!slow`, `!blind`, `!chicken`, `!hole`, `!block`.
- Commands are converted to internal `SabotageEvent` objects and delivered to the Minecraft Addon.
- The Minecraft Addon executes effects in a BDS world and ACKs processed events.
- Strong effects such as TNT and creeper are disabled in the MVP.
- Debug endpoint is used for local development when YouTube polling is disabled.

No Demo Credentials

No demo username or password is provided because the API client has no public login system. OAuth authorization is performed by the channel owner only.
