

# Architecture Diagram Evidence

API client: **sabotage-minecraft**

Repository: <https://github.com/hakonikomoru/sabotage-minecraft>

Prepared: 2026-06-04

This architecture diagram explains how YouTube Live Chat and debug events are processed by the local Bridge Server and delivered to the Minecraft Bedrock Dedicated Server Addon.

**Design principle: Addon is platform-independent. OAuth/API credentials stay in Bridge only.**

## Quota Reduction

- YouTube Live Chat polling runs only while the Minecraft game is active.
- Minimum polling interval is 15 seconds.

- Development testing uses debug POST with YouTube polling disabled.
- The Bridge Server can continue operating debug mode if YouTube connection is unavailable.
