

Quota Rationale Evidence

API client: **sabotage-minecraft**

Repository: <https://github.com/hakonikomoru/sabotage-minecraft>

Prepared: 2026-06-04

Quota Request Summary

Requested quota	50,000 units per day
Primary endpoint	liveChatMessages.list
Expected API request volume	Less than 1,000 requests per day in normal use
Reason for extension	Default 10,000 units/day can be exhausted during live development or multiple stream sessions because YouTube Live Chat has no webhook and requires polling.

Usage Estimate

- One game lasts about 10 minutes.
- The Bridge Server enforces a minimum 15-second polling interval.
- 10 minutes / 15 seconds = about 40 polling requests per game.
- At approximately 5 units per liveChatMessages.list call, one game uses about 200 units.
- 50,000 units/day provides enough headroom for pre-stream validation, multiple game rounds, and legitimate testing without excessive polling.

Implemented Quota Controls

- YouTube polling is disabled during development unless `ENABLE_YOUTUBE_CHAT=true`.
- YouTube polling occurs only while the Minecraft game is running or paused.
- Idle state uses no YouTube API polling for live chat.
- Minimum polling interval is 15 seconds, even when the API returns a shorter interval.
- The debug endpoint can test Minecraft integration without using YouTube quota.
